Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                 DB

mammals, including humans. SAG1 is anchored to the plasma membrane of T. gondii via a GPI (glycosylphosphatidylinositol) anchor, which is attached to the C-terminal anchor region (residues 308-336). The invention provides a truncated SAG1 protein, which lacks the anchor region and comprises amino acids 48-307, and a SAG protein N-terminally fragments can be used in the manufacture of a subunit vaccine for the Toxoplasma vaccine is available, but cannot be administered to humans due to, the risk of reversion of the attenuated strain to a virulent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                 The invention relates to the recombinant production of the toxoplasma antigen SAG1 or a fragment thereof in the yeast Pichia pastoris. SAG1 is the major surface antigen of Toxoplasma gondii, an obligate intracellular protozoan parasite responsible for toxoplasmosis in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to use of a prosaposin-related peptide or derivative, in the production of a medicament for use in preventing or delaying cell death, or in promoting the expression of cell death supporting gene product Bcl-XL. The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure;

                                                         AAR83791 is an amino-terminal peptide of a virus infection factor derived from heat-treated silkworm body fluid. The new virus infection factor (VIF) is useful for promoting the infection of insect cells with recombinant nuclear polyhedrosis virus. The virus having been recombined with a useful protein-expressing gene. The insect been recombined with a useful protein-expressing the insect that it is the combined with a useful protein-expressing gene. The insect been recombined with a useful protein-expressing the insect that it is the combined with a useful protein-expressing gene. The insect that it is the combined with a useful protein-expressing gene.
                                              yields.

                                                                                                                                                                                            RESULT
                                                                                                                                                                                                        The peptide given in AAR70773, corresponding to amino acids 8-29 o human saposin-C (AAR70784), promotes neurite outgrowth in vitro. A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptide (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                                                                                                                                                                                                                                                                                             Stimulating neural cell out-growth and myelination - with pro:saposin, saposin C or new neurotrophic peptide(s) from cytokine(s), for treating nervous system diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Erythropoietin; EPO; cytokine; myelination; nervous system; neurotrophic peptide; multiple sclerosis; leukoencephalitis; adrenal leukodystrophy; neuroblastoma.
                 Cytokine hEPO AB loop derived peptide.

It can be used to stimulate neurite outgrowth, inhibit neural cell death, promote myelination or inhibit demyelination. The method is used to alleviate neuropathic pain resulting from a peripheral nerv disorder, such as neuroma, nerve compression, crush or stretch and incomplete nerve transsection, mononeuropathy or polyneuropathy. Alternatively the neuropathic pain results from a disorder of the dorsal root ganglia, spinal cord, brainstem, thalamus or cortex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      has been developed of alleviating or preventing neuropathic pain in a subject, comprising administering an effective amount of an active fragment of prosaposin to the subject. The prosaposin derived peptide is useful for therapy of neural or demyelination disorders in neural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neural cell death; inhibition; myelination; neurite outgrowth; neuropathic pain; peripheral nerve disorder; neuroma; mononeuropathy; polyneuropathy; dorsal root ganglia; spinal cord; brainstem; thalamus; cytokine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prosaposin-derived peptide - useful for therapy of neural demyelination disorders in neural tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      O'Brien JS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO9732895-A1

The processes CC may be used for treatment of neuropathic pain resulting from peripharal CC stretch, incomplete nerve transsection, mononeuropathy or polyneuropathy) CC thalamus or the cortex. The receptor agonists do not cause undesirable CC side effects. The present sequence represents a prosaposin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The method comprises contacting CTLs from the patient with the immunogenic peptide (containing defined motifs) which binds one of the four HLA MHC products HLA-A3.2, HLA-A1, HLA-A1 or HLA-A24.1, the peptide having a dissociation constant (Kd) of less than 5 x 10-7 M. Immunogens are viral, e.g human immunodeficiency virus type I (HIV-1), hepatitis B virus (HBV) and

They can also be used for e.g. enhancing or directing neurite outgrowth, facilitating wound healing of reducing scar tissue, or enhancing adhesion of foreign tissue in a mammal. They can also be used for treating e.g. psoriasis, arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diagnosis and in bioreactors.                                                                                                                                                                                                                          immunosuppressive; antiinflammatory; antiallergic; virucide; antidiabetic; thyromimetic; antithyroid; vasotroplo; cardiant; antiulcer; conditant; antivological; cardiant; antivological; cophthalmological; and nephrotropic activity. The toxin is particularly mediated disease condition, where the antigen specific antibody is completed by an antigen-reactive B cell population present in a host. The coxin is useful for treating allergies, viral disease conditions, and complete commune disorders. Also treated are skin diseases; autoimmune disorders. Also treated are skin diseases; autoimmune communopathies; vasculitic syndromes; cardiovascular diseases; collagen vascular diseases; renal diseases; pulmonary diseases; collagen vascular diseases; renal diseases; pulmonary diseases; collapha 3 domain epitope peptide. An antibody response to this antigen is using the toxin of the invention.
                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a B cell clonal toxin. The toxin is made from two moieties, the first causes the toxin to be internalised by a B cell, and the second is a biologically acceptable toxin. The invention includes a method for inactivating/killing an antigen specific B cell. A target B cell is contacted with an effective amount of a B cell clonal characterised by the presence of an unwanted or deleterious immune response, e.g. in the treatment of antigen specific antibody mediated disease conditions. Use of the B cell clonal toxin can result in
                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B cell clonal toxin useful for treating autoimmune disorders such Grave's disease, myocardial infarction, Crohn's disease, multiple sclerosis, comprises a group that causes toxin to be internalized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 35; 46pp; English.

                    This peptide is an example of a peptide which binds to a human leucocyte antigen HLA-DQ4 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence AAVO5953, by screening with an HLA-DQ4 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases.

The peptide was used as an antigen to raise yclonal antibodies. These antibodies recognize a protein of roximately 33KDa which is only present in iron starved plants.

B
                                                                 The merosin protein has an apparent mol. wt. of about 800 kD and is composed of four polypeptides with molecular weights of 300, 200, 200 and 80 kD. The 300 kD polypeptide is joined to the 200 kD polypeptides by disulphide bonds and the 300 and 80 kD polypeptides comprise the major subunit protein given in AAR71729. Merosin is found in placenta, compared to the 200 kD polypeptides of the major subunit protein given in AAR71729. Merosin is found in placenta, compared to the 200 kD polypeptides comprise the complexes, amoung other tissues. The 380-400 major merosin subunit also yields a 65 kD subunit. The 380-400 merosin subunit has been designated merosin polypeptide, merosin subunit, M chain or laminin M chain. These peptides may be used as antigens to raise anti-merosin antibodies. These antibodies may be used in the detection of merosin, as the absence of merosin in a tumour sample indicates malignancy. Contacting a compared to contacting inhibitors of neurite outgrowth, thereby also promoting the outgrowth. Merosin also promotes cell attachment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local

                                                                                                                                                                                                                                                                                                                                       the human laminin A chain. Mature human merosin is 30 amino acids larger than the human laminin A chain. Similarly to all laminin chains, the merosin protein has distinct domains which are predicted to have globular regions, cysteine-rich rod-like regions and helical structures. The merosin protein has an apparent mol. wt. of about 800 kD and is
                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR71731-32 represent peptides derived from the human 380-400 kD merosin major subunit protein. Merosin is an isoform of laminin and shows structural and sequence similarity to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to two kinds of DNA sequences of coded human serum albumin (HSA), i.e. design of structure-modified gene segment of HSA and artificial total synthesis and a production process for large-scale production of genetic recombinant HSA by using methanol, yeast and engineering bacterium, and discovers that the of HSA. The production process can make the expression quantity obtain high-level expression under the drive of promoter induced by fermenting liquor culture medium, and provide reliable test data for present sequence is given in the exemplification of gene engineering HSA. The invention

                                                                                                                                                    disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-ApP), the microtubule associated protein 2 (MAP2), neurofilament-L, neurofilament-M, neurofilament-F, presenilin I, presenilin I, gilal fibrillary acidic protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) proto-oncogene, semaphorin III, HUPF-1, high mobbility group protein-C (HMGP-C) and neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel method for the diagnosis of a caused by, or associated with, an RNA molecule that has a fram mutation. The method is used to diagnose age-related diseases, cancer and a wide range of neurodegenerative disorders (e.g. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also for treatment and prevention with specific ribozymes or wild-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (UYUT-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is one of a large number of complementary peptide ligands generated from Mycoplasma genitalium genome sequences. These specific complementary peptides interact with their relevant target antagonising complementary peptides interact with their relevant target antagonising or agonising specific interaction of a protein with another protein or receptor and are thus useful as reagents and drugs, and as lead ligands to facilitate drug design and development. They configuration of high-throughput screens, as a starting point for the medicinal chemistry manipulation, for peptide mimetics and as facilitates understanding of protein-protein interactions. The method allows for analysis and acquisition of peptide sequences facilitates understanding of protein-protein interactions. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sampling problems. The set of complementary peptides includes intermolecular (between proteins) and intermolecular (within a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    facilitates understanding of protein protein interactions. The method allows for analysis of an entire database at a time, thus overcoming sampling problems. The set of complementary peptides includes both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Complementary peptide ligands as reagents and drugs for drug discovery programs and as lead ligands to facilitate drug design and development, are generated from microbial genome sequences

                                                                                                                                                                                                                                                                                                                                                                        11-JUN-1991
                                                                                                                                                                                                                                                                                                                                                                                                                        AAR11465 standard; peptide; 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful for preparing a pharmaceutical composition and for disrupting an interaction between TRAM sequence and TRIM sequence in vitro, thereby cells especially cancer cell. Compounds which disrupt interaction between TRIM/TRAM containing polypeptides can be used therapeutically to prevent or treat viral diseases and tumours. The polypeptides reduce susceptibility of cells to viral infection and regulate cell cycle antibodies against the TRIM or TRAM sequences. HPV types associated with high risk or low risk of cervical cancer can be distinguished (CBP) TRAM sequence. The present sequence represents a TRIM from an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                     AAR11465;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a polypeptide comprising a transcriptional adaptor motif (TRAM) or a TRAM-interaction motif (TRIM) (I). (I) can be used for identifying compounds (II) comprising a polypeptide capable of disrupting an interaction between a TRAM sequence and/or a TRIM sequence. Polypeptides which bind to a TRAM sequence or a determining if the polypeptide interacts with (I). Compound (II) is marked in the polypeptide interacts with (I).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polypeptides cells useful for treating viral disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Fig 2; 73pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Local Similarity

                        The present sequence represents a mimotope which functionally mimics a binding site for a monoclonal antibody (MAb) which recognises an epitope within the human platelet glycoprotein (gp) Ib/IX complex. More specifically the MAb is SZ-2. The mimotope peptide can be used for raising antibodies, as probes to search for anti-mimotopes and to neutralise the inhibitory activity of those antibodies which recognise the epitope which is mimicked by the peptide. Anti-mimotopes can be used to modulate the adhesion, aggregation or agglutination of platelets by affecting von Willebrand factor interaction with the platelets through the gp Ib/IX receptor, e.g. as an anti-thrombotic drug which inhibits the ristocetin induced aggregation of platelets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This lepidoptera allostatin (LAS) polypeptide analogue is an example of a highly generic polypeptide sequence. It exhibits LAS-like activity and inhibits juvenile hormone (JH)-I, -II and -III activity in lepidoptera. It is used as an insecticide or

                                                                                       This invention describes novel polypeptides of formula RaXRb where X = C(=0), HNC(=5), HNC(=0)CH2 or CH2; Ra = fluorescein, rhodamine, Texas red, a 'Bodipy' (RTM), 'Cascade Blue' (RTM), coumarin, phycoerithryn, eosin or rosamine; and Rb = a polypeptide of 29 or 30 amino acids selected from 26 sequences given in the specification. Such peptides are useful for the treatment of hypothalamic pituitary dwarfism, burns, osteoporosis, renal failure, non-union bone fracture, acute or chronic debilitating illness or infection, wounds, lactation failure, infertility in women, cachexia in cancer patients, anabolic and/or catabolic problems, T-cell immunodeficiencies, neurodegenerative conditions or growth hormone releasing factor (GRF) receptor-dependent tumours and for reduction of the incidence of post-surgical problems and as markers for GRF receptors.
                                                                                                                                                                                                                                                                                                                                                               New polypeptide derivatives are growth hormone releasing factor receptor agonists - useful for treatment of e.g. dwarfism, burns, osteoporosis, renal failure, infections, infertility, cachexia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Growth hormone releasing factor; GRF; human; treatment; osteoporosis; hypothalamic pituitary dwarfism; burn; renal failure; infection; wound; non-union bone fracture; lactation failure; female infertility; cachexia; cancer; anabolic; catabolic; T-cell immunodeficiency; tumour; marker; neurodegenerative condition; post-surgery.

                                                                Antigenic and immunogenic conjugates contg. the peptides and a kit to detect HIV-2 in biological fluids are new. The peptides are useful for in vitro diagnosis of HIV-2 infection and some of them can be used as components of immunogens and vaccines against HIV. Antibodies raised against them can be used for treatment of AIDS.
                                                     Sequence
                                                                                                                          New peptides which have immunological properties in common with those of the epitide skeleton of the envelope protein of HIV-2 and also have a peptide structure in common with that of SIV-1 glycoprotein are claimed.
                                                                                                                                                                                     Claim 12;
